

AircraftType Entity Documentation

Overview

The **AircraftType** entity represents different types of aircraft in the Flight Management System. It extends the **ABaseEntity** class and is stored in the **parameterization** schema.

Database Configuration

- **Table Name:** `aircraft_type`
- **Schema:** `parameterization`
- **Entity Class:** `com.SENA.FlightManagementSystem.Parameterization.Entity.AircraftType`

Attributes

code

- **Type:** String
- **Description:** Unique code for the aircraft type
- **Example:** "A320"
- **Validation Rules:**
 - Required field (cannot be blank)
 - Maximum length: 10 characters
- **Error Messages:**
 - "Code is required" (when blank)
 - "Code must not exceed 10 characters" (when too long)

name

- **Type:** String
- **Description:** Name of the aircraft type
- **Example:** "Airbus A320"
- **Validation Rules:**
 - Required field (cannot be blank)
 - Maximum length: 100 characters
- **Error Messages:**
 - "Name is required" (when blank)
 - "Name must not exceed 100 characters" (when too long)

description

- **Type:** String
- **Description:** Description of the aircraft type
- **Example:** "Narrow-body commercial aircraft"
- **Validation Rules:**
 - Required field (cannot be blank)
 - Maximum length: 255 characters

- **Error Messages:**
 - "Description is required" (when blank)
 - "Description must not exceed 255 characters" (when too long)

Inheritance

This entity extends **ABaseEntity**, which provides common base functionality for all entities in the system.

API Documentation

The entity is documented with Swagger/OpenAPI annotations for automatic API documentation generation.

Usage Examples

This entity is used to categorize and manage different types of aircraft in the flight management system, such as:

- Commercial aircraft (A320, B737, etc.)
- Cargo aircraft
- Private jets
- Regional aircraft
